

### Benefits of using Rope Access

There are many benefits to using rope access, for example:-

### Quick Installation and Removal

Due to the nature of equipment used the time taken to complete the task is greatly reduced. Rope access systems can be installed in minutes and technicians can be working in a fraction of the time.

### Visual Impact

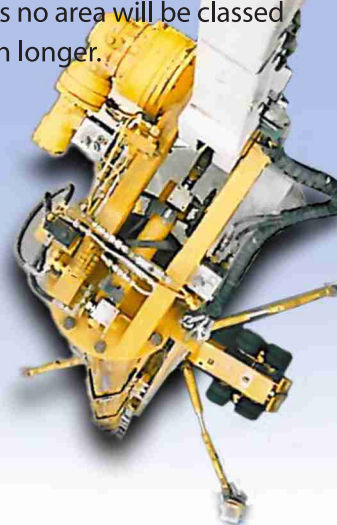

With the installation and removal being so efficient there is little or no visual impact. During breaks the system can be removed to give minimal interference of day-to-day operations.

### Areas of Use

Rope Access is ideally suited to many situations and locations. The access system can be adapted to work in confined space, atriums, building exteriors, internal foyers, bridges, masts or any area where working at height is required.

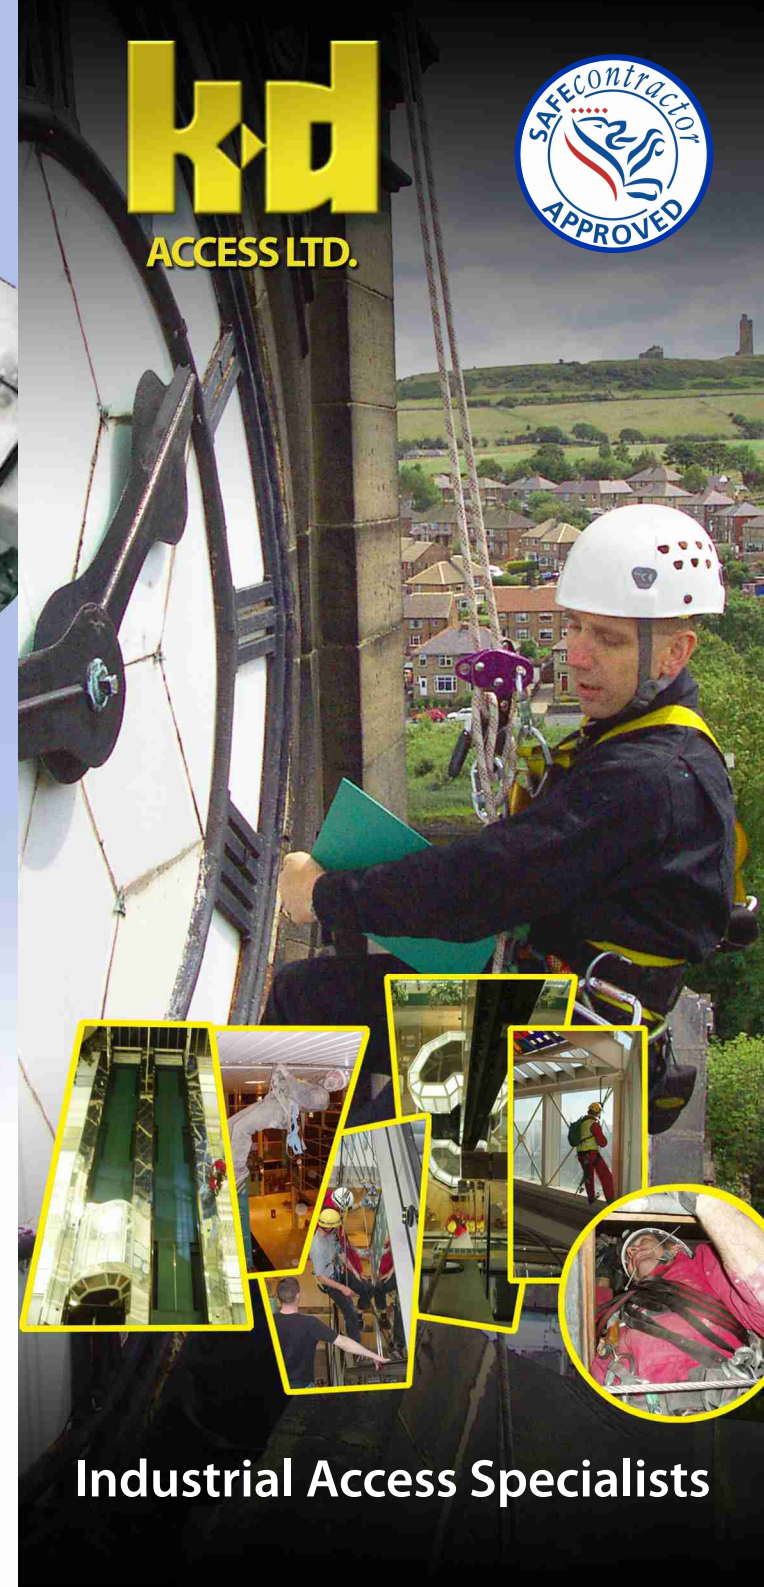

The services detailed in this brochure are the most regularly provided. However **KD Access Ltd.** is a company which specialises in working at height or in areas of difficult access. Our access system is compact and very flexible. We can provide teams of any size, which, together with the access system, can be transported to any location 24hrs a day.

Industrial Rope Access has become a recognised method of access - areas previously deemed as being out of reach are now accessible. With the development of techniques and equipment, **KD Access Ltd.** believes no area will be classed as inaccessible for much longer.

## Industrial Access Specialists

*For decades, people in the outdoors have been challenging themselves to reach places no one else can. The techniques developed by climbers and cavers have now been brought together and modified for industrial use. Our governing body, IRATA. (International Industrial Rope Access Trade Association) has worked closely with the HSE to produce accepted guidelines which guarantee quick, cost effective and, most importantly, safe access to the work site.*

### **Services Offered**

The variety of work that can be carried out is very diverse and can differ from delicate installation to debris removal and demolition.

### **Engineering**

**KD Access Ltd.** operates as the eyes of engineering companies. For example we can take samples for testing, locate water intrusion, locate tie-bar and take depth readings for re-bar.

We have laser equipment that enables us to accurately measure and calculate structural dimensions, allowing for research of possible movement within the structure.

### **Maintenance and Repairs**

This in itself offers a diverse scope of operations. For example we can restore and replace mastic seals and joints in all areas where degradation has occurred, change high level light bulbs, clear gutters and paint. If there is a problem at height or in an area of difficult access, we are

able to investigate and offer recommendations for the rectification of that fault. High level cleaning is a regularly provided service, whether it be post construction cleaning, window cleaning or jet washing.

### **Construction and Installation**

At **KD Access Ltd.** we specialise in installations. During October and November we work closely with Christmas decoration companies installing suspension points and suspending decorations. Other tasks include the installation of cable trays, wiring, cladding, glazing, signs and assisting in alarm installations, including smoke beams.

### **Personnel**

**KD Access Ltd.** work strictly within the guidelines issued by IRATA. All our Access Technicians are certified with qualifications recognised by industrial governing bodies and, through experience, have gained extensive knowledge of access and rescue systems.

### **Access Methods**

Although the bulk of the work carried out by **KD Access Ltd** requires Rope Access Technicians, we also have available 24m Spider, Vertical Personnel Platforms, and Mobile Elevated Work Platforms with qualified operators. Ladders and tower scaffold compliment our access services.
